ClinicOS

SYNTHETIC DEMO REPORT 03 · Follow-up Consultation

Patient: Aarav Sharma **ID:** CL-1024 **Age:** 24 years

Visit date: 17 July 2026 **Visit type:** Follow-up

Scenario: recurrent cough, intermittent wheezing and nasal allergy symptoms; evaluation for possible allergic asthma.

FICTIONAL DEMONSTRATION RECORD ONLY. Not a real medical record, confirmed diagnosis, or treatment instruction.

Interval history

Patient reports cough and intermittent wheezing continue on some nights. Dust exposure remains a suspected trigger based on patient observations. Response to treatment must be verified from the actual record; no response is assumed here.

Review of prior record

Previous note documents cough, sneezing and wheezing. Investigation summary includes fictional total IgE and eosinophil results, neither of which independently confirms the cause.

Assessment & plan

Persistent episodic respiratory symptoms with possible allergic component. Differential diagnosis and need for objective lung function testing remain for clinician determination. Confirm medication use if applicable and document symptom frequency and triggers.
