ClinicOS

SYNTHETIC DEMO REPORT 04 · Latest Review & Longitudinal Summary

Patient: Aarav Sharma **ID:** CL-1024 **Age:** 24 years

Visit date: 14 August 2026 **Visit type:** Review of previous visits

Scenario: recurrent cough, intermittent wheezing and nasal allergy symptoms; evaluation for possible allergic asthma.

FICTIONAL DEMONSTRATION RECORD ONLY. Not a real medical record, confirmed diagnosis, or treatment instruction.

Longitudinal summary

Across four fictional visits, the record describes recurrent cough, intermittent wheezing and nasal allergy symptoms. The patient repeatedly reports dust exposure as a possible trigger. The investigation values are non-specific; no confirmed allergen-specific test result is included.

Key facts for clinician review

- Symptoms: cough, sneezing and episodic wheezing.
- Patient-reported possible trigger: dust exposure.
- Investigation record: total IgE 210 IU/mL and absolute eosinophil count 0.42 × 10■/L (fictional values).
- No confirmed allergen-specific test result included.
- Diagnosis and treatment require clinician assessment and appropriate testing.

Suggested ClinicOS search behaviour

Searching **allergy** should return each matching source report with date, matching snippet and an action to open the original PDF. Distinguish patient-reported triggers from confirmed diagnoses and show the source for every extracted fact.
