MAGNETIC RESONANCE IMAGING (MRI) OF LUMBAR SPINE

Patient Name: Marcus Sterling	**Patient ID (MRN):** PAT-2003-8821	**DOB / Age / Sex:** 1963-02-17 (63Y / Male)
Accession #: MRI-2026-55102	**Ordering Provider:** Dr. Kevin Morales, MD	**Report Date/Time:** 2026-06-25 13:30 EST
Specimen / Exam: Lumbar Spine Without Contrast (1.5T)	**Status: FINAL SIGNED REPORT**	**Facility Code:** SJMH-MAIN-CAMPUS

CLINICAL INDICATION:

Progressive low back pain radiating into right gluteal and L5 dermatomal distribution. Assess for intervertebral disc herniation, spinal canal stenosis, or neural foraminal impingement.

TECHNIQUE:

Sagittal and axial T1-weighted, T2-weighted, and STIR sequences obtained on high-field 1.5 Tesla MRI scanner.

DETAILED LEVEL-BY-LEVEL FINDINGS:

L1-L2, L2-L3: Disc contour and signal preserved. Canal and neural foramina patent.
L3-L4: Mild broad-based disc bulge with mild facet arthropathy. Mild central canal stenosis.
L4-L5: Disc space narrowing with disc dehydration. Moderate circumferential disc bulge and right paracentral disc protrusion measuring 4 mm, contacting the exiting right L5 nerve root. Moderate right neural foraminal narrowing.
L5-S1: Mild posterior disc osteophyte complex without significant canal narrowing.

IMPRESSION:

1. Right paracentral disc protrusion at L4-L5 causing moderate right neural foraminal stenosis and contact with the right L5 nerve root, corresponding with patient's right-sided radiculopathy.
2. Multilevel lumbar spondylosis with mild central spinal stenosis at L3-L4.
